NUMBER 15

**DEMENTIA PROJECTIONS FOR THE COUNTIES,
REGIONAL MUNICIPALITIES, AND DISTRICTS
OF ONTARIO**

(USING CSHA PREVALENCE DATA)

**Robert W. Hopkins, Ph.D.
Julia F. Hopkins, B.Sc.**

December 2005

**PCCC MENTAL HEALTH SERVICES
KINGSTON, ONTARIO.**

COMMENTS

1. This document is a re-issue of Clinical/Research Bulletin No. 13 "Dementia Projections for the Counties, Regional Municipalities and Districts of Ontario" (January 2002), using the prevalence data obtained from the Canadian Study of Health and Aging (1994). The population data is from the latest available census (2001) as released by the Ontario Ministry of Finance ("Ontario Population Projections, 2004 - 2031") providing values for each year between 2004 and 2031.

2. Like Bulletin No.13, the format of this document is designed to show data for each region or county of the province, providing in each case, the population aged 65 and over, and dementia projections, for each year between 2005 and 2031. Each is in a separate block. At the bottom of each page are two graphs. "Dementia Projections 2005-2031" is a stacked bar graph showing the number of cases of dementia projected each year broken up into 5-year age groups, and "Percentage Increase Over 2005" is a simple bar graph (with two bars for each year) showing the percentage increase over the base 2005 levels for both the population aged 65 and over (black bars) and the projected dementia cases (red bars), for each year subsequent to 2005.

3. The Canadian Study of Health and Aging (1994) prevalence rates are slightly higher than those of other studies, such as Preston (1986); but whether they capture the full extent of dementia is not clear. However, dementia is being diagnosed earlier than in the past, and therefore even these higher values may be somewhat conservative.

4. It should also be noted that these rates are for dementia in general and not Alzheimer's Disease in particular. Since Alzheimer's Disease accounts, by some estimates, for 75 to 85 percent of dementia in the elderly, by itself or in combination with other forms of dementia, a rough estimate of its prevalence can also be made. However, as all forms of dementia are problematic and require a great deal of attention, it is reasonable not to confine oneself to estimates of Alzheimer's Disease alone, especially for the purpose of planning health services.

5. The year 2011 is of particular interest since it is the year that the first of the "baby boomers" reach 65. After that and until about 2040, figures will rise substantially.

6. Since age is the most significant and easily identifiable risk factor for dementia, these projections are simply the product of observed dementia rates (prevalence) and population values; no other factors are used in their calculation. Unless significant changes to the projected population trends occur, only very substantial advances in preventative treatment could alter these projections. The population projections are for both males and females, and while the observed incidence of dementia seems to be higher in females than males, the survival rate is also higher in females and this may account for most if not all the difference. The population figures take survival rates into account.

It should also be noted that when projecting population estimates one must consider a number of factors such as birthrate, mortality, immigration, etc. Since estimates of these factors may vary, population projections, especially in the more distant future could therefore fall in a large range. The population projections used by the Ministry of Finance are in the middle of the estimated range.

7. There are two major consequences of these data for the Province of Ontario. First, **the elderly portion of the population (i.e. those aged 65 and over) will continue to increase greatly in the near future**, by approximately 13% (over 2005 levels) in 2010, nearly 60% by 2020, and 126% by 2031. **This will lead to a great increase in all age related medical disorders, and an increased need for other social and recreational services for the healthy elderly.**

Second, **the prevalence of dementia is also increasing rapidly.** By 2010 the number of cases will increase by nearly **17%** over 2005 levels. By 2020 the increase will be nearly **55%**, and by 2031 that increase will be nearly **127%**. That means that we will be caring for over **175,000** cases in 2010 compared to about **150,000** at present, and by 2031 there will be over **340,000** cases in the province.

These increases in dementia cases (see graphs "Percentage Increase Over 2005") are caused by the fact that not only is the number of elderly rising, but the oldest age categories (i.e. "85 - 89", and "90+") will be growing even more rapidly, and they have the highest rates of dementia (e.g. over 50% in the 90+ age group). See also, the graph "Dementia Rates By 5 Year Age Groups".

These problems will be especially difficult for those municipalities across the province that have grown very rapidly in recent years. These communities, like those surrounding Toronto (the "905 area"), have grown largely due to the influx of "baby boomers" moving to new suburbs. This has produced a number of large and relatively "young" communities which have relatively few elderly people living in them. As these communities age in the coming years, they will experience exceptionally large increases in both the elderly population and cases of dementia. For example, while some rural counties such as Timiskaming will only show a dementia case increase of 58% by 2031, **regions such as York will experience more than a 290% increase!** These huge increases will put significant strains on their local health care facilities, especially if effective planning is not started immediately.
